The receptor concept is so central to today's pharmacology that it is difficult to see its history as anything but a century of triumphant progress. We just know how the story turns out, so that in spite of the authors' explicit rejection of an old-fashioned "history of ideas" approach (p. 2), we know that it will begin with Paul Ehrlich's imaginary side chains of the 1880s and end with the **A binding question: the evolution of the receptor concept**

In present-day pharmacology and medicine, it is usually taken for granted that cells contain a host of highly specific receptors. These are defined as proteins on or within the cell that bind with specificity to particular drugs, chemical messenger substances or hormones and mediate their

effects on the body.

A short history of the drug receptor concept. - Durham

Humans have long used plant and animal extracts for their medicinal properties but until the end of the 19th century their actions were often explained in a speculative manner. The systematic study of drugs did not begin until the 1860s, and the concept of receptors as the target of their effects in the body only emerged at the end of the 19th
