Fuel is introduced or injected to the engine by firing (opening) the injector for a pre-determined period of time once per engine revolution or per engine cycle, the longer the injector is held open the more fuel is introduced. This injector time is known as the pulse width and the technique of varying fuel in this manner is known as pulse width modulation as it is the pulse width.

The gas engine will not run long once the diesel fuel gets from the gas tank up to the motor. Once the motor dies, it won't restart. To get it running again will involve draining all the diesel fuel from the tank, purging the fuel lines to get gas back up to the motor, and perhaps pulling and cleaning the fouled spark plugs.
