Not all geothermal energy comes from power plants.

Geothermal heat pumps can do all sorts of things from heating and cooling homes to warming swimming pools. These systems transfer heat by pumping water or a refrigerant (a special type of fluid) through pipes just below the Earth's surface, where the temperature is a constant 50 to 60 F.

How Geothermal Energy Works | Union of Concerned Scientists

How Geothermal Energy Works Heat from the earth can be used as an energy source in many ways, from large and complex power stations to small and relatively simple pumping systems. This heat energy, known as geothermal energy, can be found almost anywhere as far away as remote deep wells in Indonesia and as close as the dirt in our backyards.

Geothermal | Department of Energy

Geothermal energy is heat derived below the earth's surface which can be harnessed to generate clean, renewable energy. This vital, clean energy resource supplies renewable power around the clock and emits little or no greenhouse gases -- all while requiring a small environmental footprint to develop.

Geothermal power - Wikipedia

The largest group of geothermal power plants in the world is located at The Geysers, a geothermal field in California, United States. As of 2004, five countries (El Salvador, Kenya, the Philippines, Iceland, and Costa Rica) generate more than 15% of their electricity from geothermal sources.

Geothermal | Student Energy

Geothermal is an environmentally friendly technology because it produces little to no greenhouse gas emissions. Although geothermal energy is currently a small portion of the world's energy supply mix, it holds great potential for future development because it is a reliable source of power generation that can serve base-load electricity needs.

What's Good and What's Bad about Geothermal Energy?

Heat from the earth, called geothermal energy, is another clean and sustainable source of power. Geothermal energy is nothing more than the internal heat that is contained in the rock and fluids beneath the earth's crust. The Earth's core is about 4,000 miles (6,437 km) beneath the surface and
