The Organometallic HyperTextBook: Olefin Polymerization

Like the Kaminsky type catalysts, the Jordan type catalysts have exceptional tunability via the metal ligands. The early versions of these catalysts showed only modest activity, due to competition for the active site between the olefin and the ether.

"Catalysis is more art than science", probably all of you have heard and even used this expression. Whether it is true or not, it alludes to the experience that new catalysts are hard to find, and near impossible to predict. Hard work and a lifetime of experience is invaluable. However, a keen mind

Chapter 14 Organometallic Reaction and Catalysis

14-3 Organometallic Catalysts; olefin metathesis More active and less sensitive to oxygen and water Alkyne metathesis Ring-opening polymerization of norbornene.

14-4 Heterogeneous Catalysts The reactions occurring on the surface of the catalyst may be extremely difficult to ascertain Practically important . 14-4 Heterogeneous Catalysts; ziegler-natta polymerizations. 14-4 Heterogeneous

When air reacted with the concentrated trim ethyl aluminum solution, sufficient amounts of methylaluminumoxanes were formed, and the lazy catalyst dormant in the NMR tube suddenly became sensationally active. Ziegler and Kaminsky were lucky and had the genius needed to take advantage of their luck.

The discoveries of organometallic catalysts for olefin polymerization by Karl Ziegler and that of stereoregular olefin polymers by Giulio Natta are probably the two most important achievements in the areas of catalysis and polymer chemistry in the second half of this century. They led to the development of a new branch of chemical industry, and to a large volume production of high-density and
