Virus-induced gene silencing (VIGS) is one of the reverse genetics tools for analysis of gene function that uses viral vectors carrying a target gene fragment to produce dsRNA which trigger RNA-mediated gene silencing.

[Virus-Induced Gene Silencing as a Tool for Delivery of ...](#)

Virus-induced gene silencing (VIGS) has gained acceptance as the tool of choice for transient induction of silencing. It involves creation of engineered viruses carrying sequences corresponding to the host gene to be silenced. Infection leads to synthesis of viral dsRNA, an intermediate step in viral replication. This activates the anti-viral RNA silencing pathway, resulting in down-regulation.

Virus-Induced Gene Silencing (VIGS) is one of these tools to suppress expression level of the gene of interest in plants [3, 4]. The term VIGS was first coined by A. van Kammen to describe the resistance event against viral infection [5].

A para-genetic approach, called virus-induced gene silencing (VIGS), offers a rapid means of gaining insight into gene function in plants. VIGS system could be used to suppress endogenous gene expression by infecting plants with a recombinant virus vector (VIGS vector) carrying host-derived sequence.
